Rationale

- SCID-5, Clinician Version
- Diagnostic Accuracy
- User's Manual and supplementary interview questions

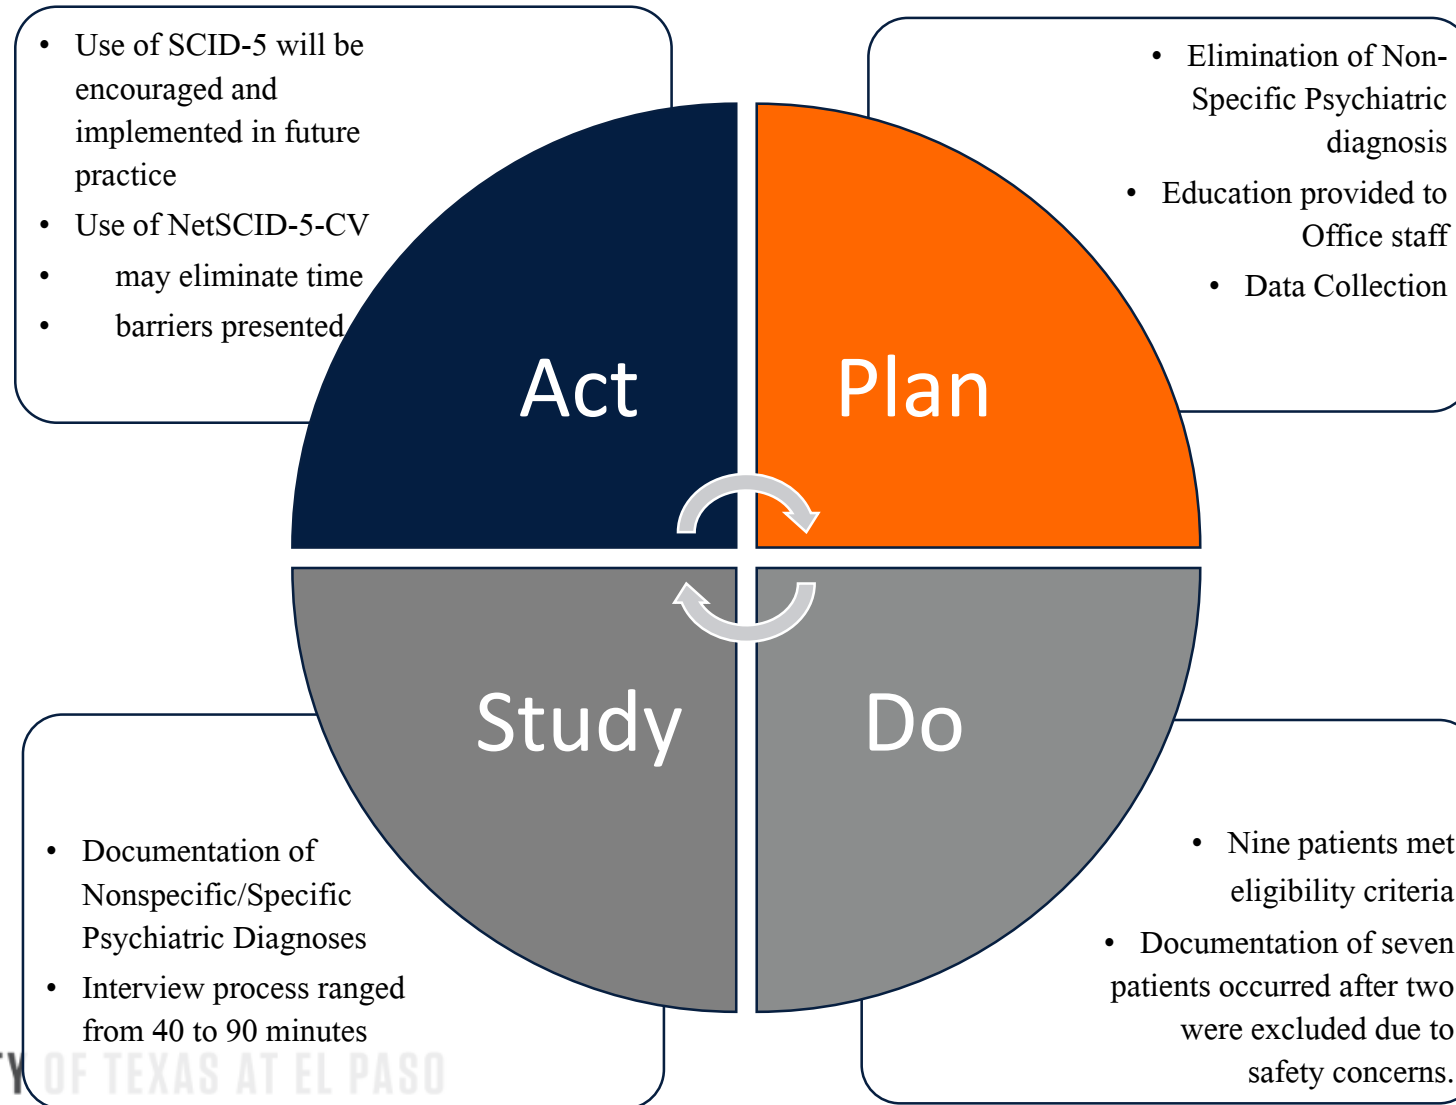

PICOT

In adults ages 18 to 35 requesting an initial evaluation, how does use of the SCID-5-CV compare to the use of the PHQ 9, GAD 7 and MDQ by the PMHNP in the interview process affect the result of non-specific psychiatric disorders being diagnosed within an hour?

Method

- PDSA Cycle
- Quality Measures
- Specific Aim of QI project

Study of Intervention

Findings

- Nine patients met eligibility criteria, two were excluded
- SCID-5-CV was used in the evaluation of
 - Five women; two men
 - Ages 18 to 60
 - Four via telehealth; three in person

Results

- All seven evaluations resulted in the documentation of specified psychiatric diagnoses at the end of the initial evaluation

Mood Disorders
Major Depressive Disorder, single episode, mild F32.0
Major Depressive Disorder, single episode, moderate F32.1
Major Depressive Disorder, single episode, severe without psychotic features, F32.2
Major Depressive Disorder, recurrent, moderate F33.1
Major Depressive Disorder, recurrent severe, without psychotic features, F33.2
Dysthymic Disorder, F34.1
Anxiety Disorders
Generalized anxiety disorder, F41.1
Post-traumatic stress disorder, chronic F43.12
Panic Disorder (episodic paroxysmal anxiety) F41.0
Substance Use Disorders
Alcohol dependence with withdraw, with perceptual disturbance F10.232
Cocaine use disorder, moderate in early remission F14.11
